Forgot Password Recovery (Reset) using PHP and MySQL

Enter Your Email Address:	Enter New Password:
<input type="text" value="username@email.com"/>	<input type="password"/>
<input type="button" value="Reset Password"/>	Re-Enter New Password:
	<input type="password"/>
	<input type="button" value="Reset Password"/>

DOWNLOAD

Today i will explain how to reset your account password using PHPMailer, PHP and MySQL, in this tutorial i will implement **Forgot Password Recovery (Reset) using PHP and MySQL**. Before moving towards the reset your password first we need a [user registration and login script in php](#), so if you do not know how to register user and login, you can check out my tutorial about [Simple User Registration & Login Script in PHP and MySQL](#).

To implement forgot password recovery, i will suggest you all to download and set up user registration script so that you can add forgot password functionality in it. However, it is not mandatory if you are an advance user and you can integrate it in your project then you do not

need to set it up.

In my user registration tutorial there is a table name `users`, we will use the same table to check if user exist or not. You will add files of this tutorial in [user registration and login script](#) folder.

We will send an email using PHPMailer, if you do not know how to use PHPMailer so you can check my PHPMailer tutorial, i have wrote a detailed tutorial about [how to send email in PHP using PHPMailer](#).

Steps to Forgot Password Recovery (Reset) using PHP and MySQL

We have to follow these steps to implement forgot password functionality.

1. Create a Temporary Token Table
2. Create a Database Connection
3. Create an Index File (Send Email)
4. Create a Reset Password File
5. Create a CSS File

Let me give you a quick review of it, first we will create a table to store a token valid for one day for any user. We will also create a form that will take input of email, then we will check if email exist or not, if email is found a temporary token will be generated and email will be sent to the user with the generated token.

Once user clicked on the email token link within one day, user can reset new password. For that purpose we will also create another form that will take input of new password and update it in user table and we will also remove the temporary token from temporary token table once user successfully updated password.

1. Create a Temporary Token Table

We need to create temporary token table, run the following query.

```
CREATE TABLE `password_reset_temp` (  
  `email` varchar(250) NOT NULL,  
  `key` varchar(250) NOT NULL,  
  `expDate` datetime NOT NULL  
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

I have also attached sql file of this table in the download file of this tutorial.

2. Create a Database Connection

Create a database connection file with name `db.php` and add the following script in it, don't forget to change your database credentials in this file.

```
$con = mysqli_connect("localhost","root","","register");  
    if (mysqli_connect_errno()){  
        echo "Failed to connect to MySQL: " . mysqli_connect_error();  
        die();  
    }  
  
date_default_timezone_set('Asia/Karachi');  
$error="";
```

We have also define the date timezone, you can set it as per your location. This helps to store data in the timezone of your location.

3. Create an Index File (Send Email)

Now create an `index.php` file that will take email input and send an email to the user if user is found in the `users` table. `users` table is available in the login and registration script, we are using the same table.

Add the following script in `index.php` file.

```
<?php
include('db.php');
if(isset($_POST["email"]) && (!empty($_POST["email"]))) {
$email = $_POST["email"];
$email = filter_var($email, FILTER_SANITIZE_EMAIL);
$email = filter_var($email, FILTER_VALIDATE_EMAIL);
if (!$email) {
    $error .= "<p>Invalid email address please type a valid email address!</p>";
} else {
    $sel_query = "SELECT * FROM `users` WHERE email='".$email."'";
    $results = mysqli_query($con,$sel_query);
    $row = mysqli_num_rows($results);
    if ($row=="") {
        $error .= "<p>No user is registered with this email address!</p>";
    }
}
if($error!="") {
    echo "<div class='error'>".$error."</div>";
    <br /><a href='javascript:history.go(-1)''>Go Back</a>";
} else {
    $expFormat = mktime(
```

```

date("H"), date("i"), date("s"), date("m") ,date("d")+1, date("Y")
);
$expDate = date("Y-m-d H:i:s",$expFormat);
$key = md5(2418*2+$email);
$addKey = substr(md5(uniqid(rand(),1)),3,10);
$key = $key . $addKey;
// Insert Temp Table
mysqli_query($con,
"INSERT INTO `password_reset_temp` (`email`, `key`, `expDate`)
VALUES ('".$email."', '".$key."', '".$expDate."');" );

$output=<p>Dear user,</p>;
$output.=<p>Please click on the following link to reset your password.</p>;
$output.=<p>-----</p>;
$output.=<p><a href="https://www.allphptricks.com/forgot-password/reset-password.php?
key='.$key.'&email='.$email.'&action=reset" target="_blank">
https://www.allphptricks.com/forgot-password/reset-password.php
?key='.$key.'&email='.$email.'&action=reset</a></p>;
$output.=<p>-----</p>;
$output.=<p>Please be sure to copy the entire link into your browser.
The link will expire after 1 day for security reason.</p>;
$output.=<p>If you did not request this forgotten password email, no action
is needed, your password will not be reset. However, you may want to log into
your account and change your security password as someone may have guessed it.</p>;
$output.=<p>Thanks,</p>;
$output.=<p>AllPHPTricks Team</p>;
$body = $output;

```

```
$subject = "Password Recovery - AllPHPTricks.com";

$email_to = $email;
$fromserver = "noreply@yourwebsite.com";
require("PHPMailer/PHPMailerAutoload.php");
$mail = new PHPMailer();
$mail->IsSMTP();
$mail->Host = "mail.yourwebsite.com"; // Enter your host here
$mail->SMTPAuth = true;
$mail->Username = "noreply@yourwebsite.com"; // Enter your email here
$mail->Password = "password"; //Enter your password here
$mail->Port = 25;
$mail->IsHTML(true);
$mail->From = "noreply@yourwebsite.com";
$mail->FromName = "AllPHPTricks";
$mail->Sender = $fromserver; // indicates ReturnPath header
$mail->Subject = $subject;
$mail->Body = $body;
$mail->AddAddress($email_to);
if(!$mail->Send()){
    echo "Mailer Error: " . $mail->ErrorInfo;
}else{
    echo "<div class='error'>
    <p>An email has been sent to you with instructions on how to reset your password.</p>
    </div><br /><br /><br />";
}
}
```

```
}else{  
?>  
<form method="post" action="" name="reset"><br /><br />  
<label><strong>Enter Your Email Address:</strong></label><br /><br />  
<input type="email" name="email" placeholder="username@email.com" />  
<br /><br />  
<input type="submit" value="Reset Password"/>  
</form>  
<p>&nbsp;</p>  
<p>&nbsp;</p>  
<p>&nbsp;</p>  
<?php } ?>
```

This file is simply checking if email is available in database then generate a random token, save that token in temporary table and send an email to the user with link. Once user click on the link user will be able to set new password.

Please note that i have been using <https://www.allphptricks.com/forgot-password/> directory URL in the above script, it should be replace with your project URL where you will upload files of this tutorial.

4. Create a Reset Password File

Now create a rest password file, this will check that is token available in database against the user email and it should be less then one day old, once token expired user will need to regenerate token.

So if token is found user can simply set new password, we will update user password and also delete the token from temporary token table.

Insert the following script in `reset-password.php` file.

```
<?php
include('db.php');
if (isset($_GET["key"]) && isset($_GET["email"]) && isset($_GET["action"])
&& ($_GET["action"]=="reset") && !isset($_POST["action"])){
    $key = $_GET["key"];
    $email = $_GET["email"];
    $curDate = date("Y-m-d H:i:s");
    $query = mysqli_query($con,
        "SELECT * FROM `password_reset_temp` WHERE `key`='".$key.'" and `email`='".$email.'"");
    );
    $row = mysqli_num_rows($query);
    if ($row==""){
        $error .= '<h2>Invalid Link</h2>
<p>The link is invalid/expired. Either you did not copy the correct link
from the email, or you have already used the key in which case it is
deactivated.</p>
<p><a href="https://www.allphptricks.com/forgot-password/index.php">
Click here</a> to reset password.</p>';
    }else{
        $row = mysqli_fetch_assoc($query);
        $expDate = $row['expDate'];
        if ($expDate >= $curDate){
            ?>
            <br />
        }
    }
}
```

```

<form method="post" action="" name="update">
<input type="hidden" name="action" value="update" />
<br /><br />
<label><strong>Enter New Password:</strong></label><br />
<input type="password" name="pass1" maxlength="15" required />
<br /><br />
<label><strong>Re-Enter New Password:</strong></label><br />
<input type="password" name="pass2" maxlength="15" required/>
<br /><br />
<input type="hidden" name="email" value="<?php echo $email;?>" />
<input type="submit" value="Reset Password" />
</form>

<?php
}else{
$error .= "<h2>Link Expired</h2>
<p>The link is expired. You are trying to use the expired link which
as valid only 24 hours (1 days after request).<br /><br /></p>";
    }
}

if($error!=""){
    echo "<div class='error'>".$error."</div><br />";
}
} // isset email key validate end

if(isset($_POST["email"]) && isset($_POST["action"]) &&
($_POST["action"]=="update")){

```

```

$error="";
$pass1 = mysqli_real_escape_string($con,$_POST["pass1"]);
$pass2 = mysqli_real_escape_string($con,$_POST["pass2"]);
$email = $_POST["email"];
$curDate = date("Y-m-d H:i:s");
if ($pass1!=$pass2){
$error.= "<p>Password do not match, both password should be same.<br /><br /></p>";
}
if($error!=""){
echo "<div class='error'>".$error."</div><br />";
}else{
$pass1 = md5($pass1);
mysqli_query($con,
"UPDATE `users` SET `password`='".$pass1."', `trn_date`='".$curDate.'"
WHERE `email`='".$email.'";"
);

mysqli_query($con,"DELETE FROM `password_reset_temp` WHERE `email`='".$email.'";");

echo '<div class="error"><p>Congratulations! Your password has been updated successfully.</p>
<p><a href="https://www.allphptricks.com/forgot-password/login.php">
Click here</a> to Login.</p></div><br />';
}
}
?>

```

Please note that i have wrote <https://www.allphptricks.com/forgot-password/> in these both files, make sure that you also update it as per your web directory URL. You will write your directory where you will set up user registration and login script.

5. Create a CSS File

Create a file with name `style.css` and keep it in folder css. Paste the following code in it.

```
.error p {  
  color:#FF0000;  
  font-size:20px;  
  font-weight:bold;  
  margin:50px;  
}
```

Why it's not working for me? Getting error in local host.

REPLY

Javed Ur Rehman says:

March 17, 2021 at 12:36 pm

Most it is caused by SMTP configuration, I would suggest you to try with Google SMTP too for localhost.

REPLY

Daniel says:

February 22, 2021 at 8:28 pm

Could you please explain to me, how does it work with the expiration Date, which deletes the generated token after one day passed without action?

Thank you, btw loved your tutorial

REPLY

Javed Ur Rehman says:

February 23, 2021 at 4:36 am

Hi Daniel, I do not delete token, I simply check if the token was generated before the expire time limit then user can reset password.

Token should not be generated before 1 day.

REPLY

Bruno G. says:

February 18, 2021 at 7:27 pm

I think there is a major security issue with this code... You could easily reset the password of any email by submitting a POST to 'reset-password.php'.

The 'key' value from the GET should also be included and validated (again) in the POST before accepting the new password.

This is the annoying thing with the web. No matter how many validations you do beforehand (PHP and JavaScript), you still need to re-validate everything just before the intended action since the request (GET or POST) can come from anywhere, not necessarily the previous page you're expecting it from.

And the md5 hash should no longer be used to store password.

Javed Ur Rehman says:

February 23, 2021 at 4:42 am

Hi thanks for you input, we are already validating email and key value before setting new password, every time a unique key is generated and sent to user's email. No one can reset password just by email only, they also need this unique which is only available to user's email.

Although, I agree that there are several things you can do to make it more secure. However, the purpose of this tutorial is to explain the password resetting, instead of making password strong and secure.

Hi, I have the exact same issue. I receive the message " Congratulations! Your password has been updated successfully." but the nex password doesn't work and the old one is still working.

REPLY

Javed Ur Rehman says:

April 22, 2021 at 12:10 pm

It seems like update query is not working, kindly make sure that your database connection is working, try to debug the code, execute the query directly on SQL to check if it is working then echo some data from database to check connectivity and echo the update query at the time of execution.

Hello, i read this tutorial and it did help me a lot. But i did find some security issues, for example you have not prepared the sql querys. wich makes it pretty easy for hackers to use sql injections. And u used \$_GET in the reset-password.php.

Can you explain why u used \$_GET and not \$_POST?

REPLY

Javed Ur Rehman says:

February 3, 2021 at 10:11 am

I tried to keep it simple as possible you can implement prepared sql or PDO.

As for as GET is concerned we can not use post method when user click on link on his email. We can only use Get methods to fetch the parameters of URL through URL.

December 13, 2020 at 4:16 pm

Hi, I manage to use the tutorial. Thank you very much. Unfortunately, after user change the password, the password is not correct. The password had change but not follow user input.

REPLY

Javed Ur Rehman says:

December 16, 2020 at 4:37 am

First check the database, if it is updated, then print the entered user and password after form submit to check if it is correct. After that you can query the same on MySQL to check if there is any record exist with the same

credentials.

Thank you for this!

Can you please make a tutorial on how to make an “remember me” function on login-page and a function where users have to activate their account by a confirmationlink sent to their email.

REPLY

Javed Ur Rehman says:

December 12, 2020 at 5:10 am

Hi Peter, for activation you can add column in your database with any name, such as activate and initially it will have 0 value, once the user click on link which we sent on email, you can simply update the user record and set activate column value to 1. Hope this will help you out, and for remember me, simply create a cookie and store in browser for any time period that you like.

This will result in a non-numeric value found (“+\$email”) and I’m not entirely sure why you would use 2 x 2418?

```
$key = md5(2418*2+$email);
```

Great tutorial though, thank you very much.

REPLY

Javed Ur Rehman says:

October 21, 2020 at 6:10 am

Dear Mark, you can use any combination for it.

REPLY

Nirmala R says:

October 16, 2020 at 10:42 am

Hi,

Until sending password reset link to the user through mail everything works fine, but when we click on the link to reset password the page is blank. I tried a many ways to echo also nothing is printing. Please help me out in this I am trying to solve this from 2 days.

Or else can u please show a demo of your tutorial with the code, that would be very useful if u show a demo how it works.

REPLY

Javed Ur Rehman says:

October 21, 2020 at 6:18 am

Hi Nirmala,

Are you trying it on localhost or your live website?

When you are clicking on link, make sure it passes all parameters and their values such as key, email and action.

Print their values and match them with that stored in DB.

Sir! Plizz solve it ...i really need the answerWrite the source code in PHP, MySQL in which user enter the number, program will reverse the number. After reversing the number, show the sum of all numbers. For example if number is 153, then after reverse it will be 351, and sum will be 9. Now if the sum is an odd number, then store the

odd number in a database table1 and store the cube of that odd number in table2.
Finally show the odd number and its cube from the database with only one query.

Sampath says:

April 26, 2020 at 10:34 am

Hi javed,

What if the user did not use the link to reset the password?

will the data in password_reset_temp get deleted after 24 hrs because if the user clicks the reset password after few days again it messes up while selecting the query

REPLY

Javed Ur Rehman says:

May 11, 2020 at 9:12 am

Daer Sampath,

Data is not deleting automatically, however you can create your own cron job to delete the data older then 24 hours later.

Hii sir, your tutorial is amazing

but i got one issue that I'm not getting reset password blank page what to do please help me!

REPLY

Javed Ur Rehman says:

May 11, 2020 at 9:17 am

Debug the issue, try to echo anything where you think issue could be there, although tutorial is working fine but may be you got error due to some other reason.

By printing anything on that page you will be able to know that where pointer is stopping.

REPLY

Lamine Ndiaye says:

April 11, 2020 at 10:02 pm

Hello Javed,

Hope you are doing fine.

First, I want to thank you for this amazing tutorial.

Second, I have implemented on my website and all works except the form to put a new password that does not appear in PC browser (Chrome, IE, Edge...) but it's appear on smartphone. I have removed the line calling the css file but I still have the same issue. Do you have any idea please ?

REPLY

Javed Ur Rehman says:

May 11, 2020 at 9:27 am

Hi Lamine,

I would suggest you to debug the code by printing anything on the page where it display new password field to make sure that pointer is coming here or not.

If nothing is printing then something is wrong and pointer is not coming to the right position.

REPLY

Syakira says:

March 12, 2020 at 4:51 am

Dear sir, thank you for your great tutorial. everything is fine for me except when I enter my email for password recovery, it has error that says:

Warning: A non-numeric value encountered in C:\xampp\htdocs\demo\index.php on line 39

Mailer Error: SMTP connect() failed. <https://github.com/PHPMailer/PHPMailer/wiki/Troubleshooting>

can you please help me sir. thank you in advance.

REPLY

Javed Ur Rehman says:

March 12, 2020 at 5:36 am

Dear Syakira,

You are not able to connect with SMTP, make sure you are using correct credentials such as email, password and host for SMTP connection, you may also try to connect with Gmail SMTP.

rashmi ranjan says:

March 5, 2020 at 7:45 am

Dear, Javed sir, i have a question.

```
$query3 = mysqli_query($db,"UPDATE user_login SET password='$password' WHERE user_login.id = 1")  
or die(mysqli_error($db));
```

this is working only when the id=1 exists in my database.

If a person enter his/her email , the id may be different na. so how could or what is the expected code to modify so that the the id related to that particular person will be selected. and the person can easily change the password.

REPLY

Javed Ur Rehman says:

March 6, 2020 at 9:47 am

Dear Rashmi,

I didn't use any place the query which you are asking, kindly check my tutorial, i have updated the table using email ID instead of ID.

REPLY

Shivam Mittal says:

March 7, 2020 at 6:26 am

make your id dynamic!!

don't define manually login.id = 1;

take your id in a variable and use it there like \$mylogId = \$row[id];

login.id = \$mylogId;

now this work for all.

REPLY

Eddy says:

February 13, 2020 at 4:27 pm

Hi Javed. I appreciate your work. It solved a problem I have been struggling with for days. With your help, I have managed to do it.

I, however, met a problem. I cannot send emails with '@gmail'. All emails with my domain are working like charm.

The emails bounced back.

Jones says:

January 26, 2020 at 4:05 am

Hi,

First just wanted to thank you for this tutorial. This is great! I have 2 probably simple questions.

1.) Why no `id` in the `password_reset_temp` table? Please help me understand this part. Is this because the keys, emails and dates are temporary? Or is it ok to add an `id` column. Just found this interesting when I tried to delete the test posts and I couldn't select them in the phpMyAdmin.

2.) My local host is throwing me this error:

A non-numeric value encountered error at

```
$keyval = md5(2418*2+$email);
```

Using php 7.2 and the update from 5* seems to throw this error. Can I remove the `$email` variable from the hash and will the code still work?

Thank You

[REPLY](#)

Jerritt J Pace says:

[December 18, 2019 at 7:46 am](#)

Please sir would you help me with what I am doing wrong. I have your system working to the password-reset.php page....the email delivers it right, and the link expires right, but the passwords do not get changed.

I have the register database with the tables set up.

My original download files hosted with the changes to allow for the sql connections is at:

CODE

Thank you so much for your help!!

Cheers,

Jerritt Pace

REPLY

Javed Ur Rehman says:

[December 23, 2019 at 4:57 am](#)

Hi Jerritt J Pace,

Before making any changes into the system, try to download the complete zip file of this tutorial and try to execute that file. If it is working properly then you should make changes. As per your issue, your updating query is not working, i would suggest try to run that query manually at your sql and check is there any syntax issue, if it is working fine then try to run the same query only on separate page and check if that query is working using PHP db connection. If you find that it is working fine the integrate that code in your system.

REPLY

Shahid says:

December 10, 2019 at 12:46 pm

The “key” is getting saved as password instead of “new password” in the DB.

REPLY

monk says:

December 9, 2019 at 12:09 pm

if code of PHPMailer is working in localhost and not working in main site host, where could be problem and site host is saying that it is your programming issue.

November 25, 2019 at 5:33 am

Hello Javed,

Thanks for sharing this wonderful tutorial. This is a very useful and desired feature in the Registration system.

Just some small suggestion:

1. Instead of creating a separate DB file password_reset_temp, why not add these three fields i.e. email, key and expDate to the 'users' DB file.
2. Could you be updating your code to support PDO (in the future, may be)

Once again, a wonderful blog. Keep it up!

Regards,

REPLY

Mark says:

October 29, 2019 at 4:41 am

and dear sir, please, i'm having a problem, please, sir i'm a newbie in the world of php, i'm rather very good at python instead, i'm working on a charity project, and i provided users opportunity to upload a profile photo, along with their informations like username, email, phone number, password, facebook id, etc, and sir i used sessions to send the user a welcome message, immediately he is registered successfully,
(FOR EXAMPLE:::
welcome mary, you have been registered successfully:::)but sir, the problem is i'm able to successfully welcome the new user like in your script too, but how can i also echo the user profile photo? tried but the errors i get is that it keeps on

echoing all the photos in the database, and end up filling the page with a lot of user photos, from all the different users, please, sir all i'm begging is, how do i echo every user information, like
USERNAME,
EMAIL,
PHONE NUMBER,
FACEBOOK ID
and
PROFILE PICTURE
for each user, with sessions, without letting one user to see the photos of another user?
thanks sir God bless

REPLY

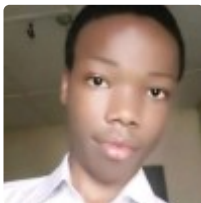

Javed Ur Rehman says:

October 29, 2019 at 5:09 am

Hi Mark, i have shared different tutorials, kindly check out my other tutorials, I hope you will get some help and to view image you must need to display image as we normally display but get the image directory URL from the database.

REPLY

Mark says:

October 29, 2019 at 10:53 am

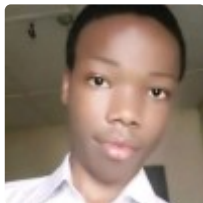

Sir, I understand that, but what I would have loved is if you could make a tutorial on how to echo image, and user informations, using sessions, if you make this tutorial, you'll see the difference, you'll have more

followers, because, this is one big problem we newbies in php are facing, and sir, I have a little piece of advice for you, please sir, add a link where your users can invite friends, so that we can invite our friends, your tutorials are great, the world needs to know so much more about your great works, if no one else will invite friends, trust me, sir, I'll do that, I'm not jealous of anyone's progress, instead I'll assist the person to progress even more, and sir, before I forget, just create this tutorial I'm telling you about, and you'll see what I'm saying, I've searched far and wide, and I've not found any tutorial like that, sir, just try your best, make us a tutorial on how to

UPLOAD USER PHOTOS IN REGISTRATION FORM

and echo it separately, to each user According to the users profile, so that a user can see only his photos, please, sir consider this request once again, thanks sir, and God bless you

October 21, 2019 at 8:41 am

Hello,

My password is reseted with the key. How can I solve that?

REPLY

Javed Ur Rehman says:

October 22, 2019 at 5:04 am

Hi Catalin,

In my tutorial, user can always set new password, if you have reset your password with the key then you can again reset the password, this time with your desired password, simply enter new password in the input field after email verification.

REPLY

Catalin says:

October 22, 2019 at 8:05 pm

hello

I mean. The key it's saved as password in the DB

REPLY

Javed Ur Rehman says:

October 23, 2019 at 2:07 pm

Catalin you must be missing something, i will suggest you to simply copy paste my tutorial and try to run it. Don't make any changes in the code, only provide database and email credentials. If it is working then you can make changes in the form.

I have tested the tutorial code and it is working fine, therefore kindly first simply copy paste my code and try to execute it.

REPLY

Hery says:

October 4, 2019 at 6:49 am

Dear Javed Ur Rehman. Thank you for the previous tutorial "Simple User Registration...". This one is a little bit more complex.

In this line : "\$key = md5(2418*2+\$email);
I got this error : "Warning: A non-numeric value encountered..."

Thank you for help.

REPLY

Dinesh says:

August 28, 2019 at 12:00 pm

Hi,

Could you please let me know how i can decrypt the password, so i can login using the changed password.

Thanks!

REPLY

Javed Ur Rehman says:

September 2, 2019 at 9:47 am

Hi Dinesh, you can see that i am using md5() to encode and decode password. You can login with your updated password, this system will proceed you with your new password.

pucs says:

July 30, 2019 at 3:37 am

<https://www.allphptricks.com/forgot-password-recovery-reset-using-php-and-mysql/>

Please considering the above tutorial, is there any means you can provide table valuables because something seems missing or not added in your tutorial.

THIS HAS INCLUDES IN THE tutorial index.php

```
}else{
$sel_query = "SELECT * FROM users WHERE email='".$email."'";
$results = mysqli_query($con,$sel_query);
$row = mysqli_num_rows($results);
if ($row==""){
$error .= "No user is registered with this email address!";
}
}
if($error!=""){
echo " ".$error."
Go Back";
}
}
$expFormat = mktime(date("H"), date("i"), date("s"), date("m") , date("d")+1, date("Y"));
$expDate = date("Y-m-d H:i:s",$expFormat);
$key = md5(2418*2+$email);
```

```
$addKey = substr(md5(uniqid(rand(),1)),3,10);  
$key = $key . $addKey;  
// Insert Temp Table  
mysqli_query($con,  
"INSERT INTO password_reset_temp (email, key, expDate)  
VALUES ('".$email."', '".$key."', '".$expDate."'),");
```

THIS CLEARLY INDICATE THERE SHOULD BE a table users and table password_reset_temp kindly provide there valuable and thanks in anticipation.

Regards,
Pucs

Hi i used your Recovery Code, recovery email was sent to my email but the new password does not update in database. My Db connector is ok.

REPLY

Javed Ur Rehman says:

April 29, 2019 at 3:41 pm

I think first you should try to execute the same query directly in phpmyadmin database, if it is working fine, then run the same query on page. If it is still working then you should check your code, either you are actually running the same query with same values that are required. You will need to debug your issue step by step.

Dear Aakash, it seems like that you have already declared PHPMailer, kindly check if you have declared it before?

I prefer that you test email on web host, i didn't test it on localhost so may be you will need to do extra work to get it working on local.

Hi Sir!

Your content is really helpful. Kindly write a blog on how we show all user list only with the admin.

Thanks Zahid.

You can list all user/data from database by following my tutorial <https://www.allphptricks.com/insert-view-edit-and-delete-record-from-database-using-php-and-mysqli/>

Hi Humble, i do share tutorials here for learning purpose, you can learn from all my tutorials, if you face any difficulty then you can ask me, i will try my best to give response as soon as possible.

But i will not be able to take any online or offline classes. So i hope you will find my tutorials helpful. Thanks
